Batch - B1

Assignment - 13

Title: SHA-512(Secured Hash Algorithm) Algorithm

<u>Aim</u>: To Demonstrate SHA-512 Algorithm

Theory:

SHA (Secure Hash Algorithm) is a set of cryptographic hash functions, they are built using the Merkle-Damgård construction, from a one-way compression function itself. They are built using the Davies–Meyer structure from a specialized block cipher.

The SHA family consists of six hash functions with digests (hash values) that are 224, 256, 384 or 512 bits.

Code:

```
0x1f83d9abfb41bd6b,

D:\BTECH\CNS_LAB\13 - SHA-512>

Conclusion:

SHA-512, or Secure Hash Algorithm 512, is a hashing algorithm used to convert text of any length into a fixed-size string. Each output produces a SHA-512 length of 512 bits (64 bytes). This algorithm is commonly used for email addresses hashing, password hashing, and digital record verification.
